Abstract

Two families \( \mathcal{A} \) and \( \mathcal{B} \) of sets are said to be cross-intersecting if each set in \( \mathcal{A} \) intersects each set in \( \mathcal{B} \). For any two integers \( n \) and \( k \) with \( 1 \leq k \leq n \), let \( \binom{[n]}{\leq k} \) denote the family of subsets of \( \{1, \ldots, n\} \) of size at most \( k \), and let \( \mathcal{S}_{n,k} \) denote the family of sets in \( \binom{[n]}{\leq k} \) that contain 1. The author recently showed that if \( \mathcal{A} \subseteq \binom{[m]}{\leq r} \), \( \mathcal{B} \subseteq \binom{[n]}{\leq s} \), and \( \mathcal{A} \) and \( \mathcal{B} \) are cross-intersecting, then \( |\mathcal{A}||\mathcal{B}| \leq |\mathcal{S}_{m,r}| |\mathcal{S}_{n,s}| \). We prove a version of this result for the more general setting of weighted sets. We show that if \( g : \binom{[m]}{\leq r} \to \mathbb{R}^+ \) and \( h : \binom{[n]}{\leq s} \to \mathbb{R}^+ \) are functions that obey certain conditions, \( \mathcal{A} \subseteq \binom{[m]}{\leq r} \), \( \mathcal{B} \subseteq \binom{[n]}{\leq s} \), and \( \mathcal{A} \) and \( \mathcal{B} \) are cross-intersecting, then

\[
\sum_{A \in \mathcal{A}} g(A) \sum_{B \in \mathcal{B}} h(B) \leq \sum_{C \in \mathcal{S}_{m,r}} g(C) \sum_{D \in \mathcal{S}_{n,s}} h(D).
\]

The bound is attained by taking \( \mathcal{A} = \mathcal{S}_{m,r} \) and \( \mathcal{B} = \mathcal{S}_{n,s} \). We also show that this result yields new sharp bounds for the product of sizes of cross-intersecting families of integer sequences and of cross-intersecting families of multisets.

Keywords: cross-intersecting families, weighted set, integer sequence, multiset

1 Introduction

Unless otherwise stated, we shall use small letters such as \( x \) to denote elements of a set or non-negative integers or functions, capital letters such as \( X \) to denote sets, and calligraphic letters such as \( \mathcal{F} \) to denote families (i.e. sets whose elements are sets themselves). It is to be assumed that arbitrary sets and families are finite. We call a set \( A \) an \( r \)-element set, or simply an \( r \)-set, if its size \( |A| \) is \( r \). For a set \( X \), the power set of \( X \) (that is, the family
of all subsets of $X$) is denoted by $2^X$, the family of all $r$-element subsets of $X$ is denoted by $\binom{X}{r}$, and the family of all subsets of $X$ that have at most $r$ elements is denoted by $\binom{X}{\leq r}$. The set of all positive integers is denoted by $\mathbb{N}$. For any $m, n \in \mathbb{N}$ with $m < n$, the set $\{i \in \mathbb{N}: m \leq i \leq n\}$ is denoted by $[m, n]$. We abbreviate $[1, n]$ to $[n]$.

We say that a set $A$ intersects a set $B$ if $A$ and $B$ contain at least one common element. A family $\mathcal{A}$ of sets is said to be intersecting if for every $A, B \in \mathcal{A}$, $A$ and $B$ intersect. Families $\mathcal{A}_1, \ldots, \mathcal{A}_k$ are said to be cross-intersecting if for every $i$ and $j$ in $[k]$ with $i \neq j$, each set in $\mathcal{A}_i$ intersects each set in $\mathcal{A}_j$.

For $x \in X$ and $\mathcal{F} \subseteq 2^X$, we denote the family $\{F \in \mathcal{F}: x \in F\}$ by $\mathcal{F}(x)$. If $\mathcal{F}(x) \neq \emptyset$, then we call $\mathcal{F}(x)$ the star of $\mathcal{F}$ with centre $x$. A star of a family is the simplest example of an intersecting subfamily.

One of the most popular endeavours in extremal set theory is that of determining the size of a largest intersecting subfamily of a given family $\mathcal{F}$. This took off with [27], which features the classical result, known as the Erdős–Ko–Rado (EKR) Theorem, that says that if $r \leq n/2$, then the size of a largest intersecting subfamily of $\binom{[n]}{r}$ is the size $\binom{n}{r-1}$ of every star of $\binom{[n]}{r}$. There are various proofs of the EKR Theorem, two of which are particularly short and beautiful: Katona’s [38], introducing the elegant cycle method, and Daykin’s [23], using the fundamental Kruskal–Katona Theorem [39, 41]. Various generalizations and analogues have been obtained; of particular note are the results in [40, 29, 50, 1].

The EKR Theorem inspired a wealth of results that establish how large a system of sets can be under certain intersection conditions; see [24, 30, 17, 33].

For intersecting subfamilies of a given family $\mathcal{F}$, the natural question to ask is how large they can be. For cross-intersecting families, two natural parameters arise: the sum and the product of sizes of the cross-intersecting families. It is therefore natural to consider the problem of maximizing the sum or the product of sizes of $k$ cross-intersecting subfamilies (not necessarily distinct or non-empty) of a given family $\mathcal{F}$. In [19], this problem is analysed in a general way, and it is shown that for $k$ sufficiently large it reduces to the problem of maximizing the size of an intersecting subfamily of $\mathcal{F}$. Solutions have been obtained for various families, as outlined in [19, 9]. Wang and Zhang [49] solved the maximum sum problem for an important class of families that includes $\binom{[n]}{s}$ and many others, elegantly combining the method in [10, 11, 12, 20, 14] and the no-homomorphism lemma [3, 21]. The solution for $\binom{[n]}{s}$ had been obtained by Hilton [35] and is the first result that addressed the cross-intersection problem described above. Pyber [47] solved the maximum product problem for $\binom{[n]}{s}$ (see also [43, 6]).

The maximum product problem for $\binom{[n]}{s}$ has been solved in [9], which actually provides the solution to the more general problem where the cross-intersecting families do not necessarily come from the same family.

**Theorem 1** ([9]). If $m, n \in \mathbb{N}$, $r \in [m]$, $s \in [n]$, $\mathcal{A} \subseteq \binom{[m]}{\leq r}$, $\mathcal{B} \subseteq \binom{[n]}{\leq s}$, and $\mathcal{A}$ and $\mathcal{B}$ are cross-intersecting, then

$$|\mathcal{A}||\mathcal{B}| \leq \sum_{i=1}^{r} \binom{m-1}{i-1} \sum_{j=1}^{s} \binom{n-1}{j-1},$$
and equality holds if $A = \{ A \in \binom{[m]}{r} : 1 \in A \}$ and $B = \{ B \in \binom{[n]}{s} : 1 \in B \}$.

We consider the more general setting where the sets are assigned weights (positive real numbers). The weight of a family is the sum of weights of its members, and the objective is to maximize the product of weights of the cross-intersecting families. Before stating our main result, we need some additional definitions and notation. We also point out that, as explained in the next section, a product result such as Theorem 1, where the product is maximum when the cross-intersecting families are stars with a particular center, automatically yields an EKR-type result and generalizes to one for $k \geq 2$ cross-intersecting families.

For any $i, j \in [n]$, let $\delta_{i,j} : 2^{[n]} \to 2^{[n]}$ be defined by
\[
\delta_{i,j}(A) = \begin{cases} 
(A \setminus \{j\}) \cup \{i\} & \text{if } j \in A \text{ and } i \notin A; \\
A & \text{otherwise},
\end{cases}
\]
and let $\Delta_{i,j} : 2^{2^{[n]}} \to 2^{2^{[n]}}$ be the compression operation defined by
\[
\Delta_{i,j}(A) = \{ \delta_{i,j}(A) : A \in \mathcal{A} \} \cup \{ A \in \mathcal{A} : \delta_{i,j}(A) \in \mathcal{A} \}.
\]
The compression operation was introduced in the seminal paper [27]. The paper [30] provides a survey on the properties and uses of compression (also called shifting) operations in extremal set theory. All our new results make use of compression operations.

If $i < j$, then we call $\Delta_{i,j}$ a left-compression. A family $F \subseteq 2^{[n]}$ is said to be compressed if $\Delta_{i,j}(F) = F$ for every $i, j \in [n]$ with $i < j$. In other words, $F$ is compressed if it is invariant under left-compressions. Note that $F$ is compressed if and only if $(F \setminus \{j\}) \cup \{i\} \in F$ whenever $i < j$, $j \in F \in F$ and $i \in [n] \setminus F$.

A family $H$ is said to be hereditary if for each $H \in \mathcal{H}$, all the subsets of $H$ are in $\mathcal{H}$. Thus, a family is hereditary if and only if it is a union of power sets. The family $\binom{[n]}{r}$ (which is $2^{[n]}$ if $r = n$) is an example of a hereditary family that is compressed. We mention that one of the central problems in extremal set theory is a conjecture of Chvátal [22] that claims that at least one of the largest interesting subfamilies of any hereditary family $\mathcal{H}$ is a star of $\mathcal{H}$; a similar conjecture for levels of $\mathcal{H}$ is made and partially solved in [15], and generalizes [37, Conjecture 7].

Let $\mathbb{R}^{+}$ denote the set of positive real numbers. For a non-empty family $F$, a function $w : F \to \mathbb{R}^{+}$ (a weight function), and a subfamily $A$ of $F$, the sum $\sum_{A \in \mathcal{A}} w(A)$ (of weights of sets in $\mathcal{A}$) is called the $w$-weight of $A$. With a slight abuse of notation, the $w$-weight of $A$ is denoted by $w(A)$. Note that if $A$ is empty, then $w(A)$ is the empty sum, which is 0 by convention.

The following is our main result, which we will prove in Section 3.

**Theorem 2.** Let $m, n \in \mathbb{N}$, and let $u, v \in \{0\} \cup \mathbb{R}^{+}$ such that $u + v \geq 2$. Let $\emptyset \neq G \subseteq 2^{[m]}$ and $\emptyset \neq \mathcal{H} \subseteq 2^{[n]}$ such that $\mathcal{G}$ and $\mathcal{H}$ are hereditary and compressed. Let $g : \mathcal{G} \to \mathbb{R}^{+}$ and $h : \mathcal{H} \to \mathbb{R}^{+}$ be functions such that
(a) $g(G) \geq (1 + u)g(G')$ for every $G, G' \in \mathcal{G}$ with $\emptyset \neq G \subseteq G'$,
(b) $h(H) \geq (1 + v)h(H')$ for every $H, H' \in \mathcal{H}$ with $\emptyset \neq H \subseteq H'$,
(c) \(g(\delta_{ij}(G)) \geq g(G)\) for every \(G \in \mathcal{G}\) and every \(i, j \in [m]\) with \(i < j\), and
(d) \(h(\delta_{ij}(H)) \geq h(H)\) for every \(H \in \mathcal{H}\) and every \(i, j \in [n]\) with \(i < j\).

If \(A \subseteq \mathcal{G}\) and \(B \subseteq \mathcal{H}\) such that \(A\) and \(B\) are cross-intersecting, then
\[
g(A)h(B) \leq g(G(1))h(H(1)).
\]

Moreover, if \(u \neq 0\) and \(v \neq 0\), then equality holds if and only if \(A = G(a)\) and \(B = H(a)\) for some \(a \in [m] \cap [n]\) such that \(g(G(a)) = g(G(1))\) and \(h(H(a)) = h(H(1))\).

In [9], it is proved that the result also holds if \(g(G) = 1 = h(H)\) for every \(G \in \mathcal{G}\) and every \(H \in \mathcal{H}\); Theorem 1 is the special case where \(\mathcal{G} = \binom{[m]}{r}\) and \(\mathcal{H} = \binom{[n]}{s}\).

The proof of Theorem 2 is based on induction, compression, and a subfamily alteration. The method can be summarized as follows. We use induction on \(m + n\). We take \(A\) and \(B\) to be such that the product of their weights is maximum. The challenging part is the observation that if we assume that this happens for both pairs, then we can construct a new pair obtained in this way may become smaller. The critical part of the proof is the induction hypothesis. Thus, we consider two alterations: removing \(A\) from \(A\) and adding \(B\backslash\{n\}\) to \(B\), and removing \(B\) from \(B\) and adding \(A\backslash\{n\}\) to \(A\). This yields two new pairs of cross-intersecting families. The second problem is that the product of the weights of a new pair obtained in this way may become smaller. The critical part of the proof is the observation that if we assume that this happens for both pairs, then we can construct a new pair of cross-intersecting families for which the product of weights is larger than that for \(A\) and \(B\) (unless we have the trivial case \(m = n = 2\)), hence contradicting the initial assumption.

2 Applications of Theorem 2

We will show that Theorem 2 yields cross-intersection results for integer sequences and for multisets.

We represent a sequence \(a_1, \ldots, a_n\) by an \(r\)-tuple \((a_1, \ldots, a_n)\), and we say that it is of length \(n\). We call a sequence of positive integers a \emph{positive sequence}. We call \((a_1, \ldots, a_n)\) an \emph{\(r\)-partial sequence} if exactly \(r\) of its entries are positive integers and the rest are all zero. Thus an \(n\)-partial sequence of length \(n\) is positive. A sequence \((c_1, \ldots, c_n)\) is said to be \emph{increasing} if \(c_1 \leq \ldots \leq c_n\). We call an increasing positive sequence an \emph{IP sequence}.

We call \(\{(x_1, y_1), \ldots, (x_r, y_r)\}\) a \emph{labeled set} (following [16]) if \(x_1, \ldots, x_r\) are distinct. For any IP sequence \(c = (c_1, \ldots, c_n)\) and any \(r \in [n]\), let \(\mathcal{L}_c^{(r)}\) be the family of all labeled sets \(\{(x_1, y_{x_1}), \ldots, (x_r, y_{x_r})\}\) such that \(x_1, \ldots, x_r \in \binom{[n]}{r}\) and \(y_{x_j} \in [c_{x_j}]\) for each \(j \in [r]\).

We may abbreviate \(\mathcal{L}_c^{(r)}\) to \(\mathcal{L}_c\). For any sets \(Y_1, \ldots, Y_n\), let \(Y_1 \times \cdots \times Y_n\) denote the Cartesian product of \(Y_1, \ldots, Y_n\), that is, the set of sequences \((y_1, \ldots, y_n)\) such that \(y_i \in Y_i\) for each \(i \in [n]\). Note that \(\mathcal{L}_c = \{(1, y_1), \ldots, (n, y_n)\}: y_i \in [c_i]\) for each \(i \in [n]\), so \(\mathcal{L}_c\) is isomorphic to \([c_1] \times \cdots \times [c_n]\). Let \(\mathcal{L}_c^{(r)}\) denote the set of all \(r\)-partial sequences in \((\{1\} \cup [c_1]) \times \cdots \times (\{10\} \cup [c_n])\). By associating \((y_1, \ldots, y_n) \in \mathcal{L}_c^{(r)}\) with the labeled set \(\{(i, y_i): i \in [n], y_i \neq 0\}\) in \(\mathcal{L}_c^{(r)}\), we obtain that \(\mathcal{L}_c^{(r)}\) and \(\mathcal{L}_c^{(r)}\) are isomorphic.

In Section 4, we prove the following result.
Theorem 3. Let \( c = (c_1, \ldots, c_m) \) and \( d = (d_1, \ldots, d_n) \) be IP sequences such that \( c_1 \geq 2 \), \( d_1 \geq 2 \), and \( c_1 + d_1 \geq 6 \). Let \( r \in [m] \) and \( s \in [n] \). If \( A \subseteq L_c^{(r)} \) and \( B \subseteq L_d^{(s)} \) such that \( A \) and \( B \) are cross-intersecting, then

\[
|A||B| \leq \left( \sum_{I \in \binom{[2,m]}{r-1}} \prod_{i \in I} c_i \right) \left( \sum_{J \in \binom{[2,n]}{s-1}} \prod_{j \in J} d_j \right).
\]

Moreover, if \( c_1 \geq 3 \) and \( d_1 \geq 3 \), then equality holds if and only if \( A = L_c^{(r)}((p,q)) \) and \( B = L_d^{(s)}((p,q)) \) for some \( p \in [m] \cap [n] \) with \( c_p = c_1 \) and \( d_p = d_1 \), and some \( q \in [c_1] \cap [d_1] \).

We say that \((a_1, \ldots, a_m)\) meets \((b_1, \ldots, b_n)\) if \( a_i = b_i \neq 0 \) for some \( i \in [m] \cap [n] \). Thus, Theorem 3 is equivalent to the following: for \( c \), \( d \), \( r \) and \( s \) as in Theorem 3, if \( A \subseteq L_c^{(r)} \) and \( B \subseteq L_d^{(s)} \) such that each member of \( A \) meets each member of \( B \), then

\[
|A||B| \leq \left( \sum_{I \in \binom{[2,m]}{r-1}} \prod_{i \in I} c_i \right) \left( \sum_{J \in \binom{[2,n]}{s-1}} \prod_{j \in J} d_j \right); \text{ moreover, if } c_1 \neq 1 \text{ and } d_1 \neq 1, \text{ then equality holds if and only if } A = \{ (a_1, \ldots, a_m) \in L_c^{(r)} : a_p = q \} \text{ and } B = \{ (b_1, \ldots, b_n) \in L_d^{(s)} : b_p = q \} \text{ for some } p \in [m] \cap [n] \text{ with } c_p = c_1 \text{ and } d_p = d_1, \text{ and some } q \in [c_1] \cap [d_1] \}
\]

It is immediate from Theorem 3 that \( c \) and \( d \) do not need to be increasing as long as there exists \( p \in [m] \cap [n] \) such that \( c_p = \min \{ c_1, \ldots, c_m \} \) and \( d_p = \min \{ d_1, \ldots, d_n \} \), in which case the maximum product is \( |L_c^{(r)}((p,1))||L_d^{(s)}((p,1))| \); it is not clear what happens if this is not the case. Theorem 3 does not always hold for \( c_1 = d_1 = 1 \); indeed, if \( c_1 = c_m = d_1 = d_n = 1 \), \( m = n = 2 \) and \( m/2 < r = s < m \), then any two sequences in \( L_c^{(r)} \) intersect, and hence we can take \( A = B = L_c^{(r)} \). The case where \( 3 \leq c_1 + d_1 \leq 5 \) seems to require special treatment and remains a problem to be investigated. However, for the special case where \( c = d \) and \( r = n \), we easily obtain from Theorem 3 the sharp bound for all values of \( c_1 \), given by the following.

Theorem 4. If \( c \) is an IP sequence, \( A, B \subseteq L_c \), and \( A \) and \( B \) are cross-intersecting, then

\[
|A||B| \leq |L_c((1,1))|^2.
\]

This result is also proved in Section 4. It was first established in the preliminary version [13] of this paper. An alternative proof has been obtained by Pach and Tardos [46].

Sum versions of Theorems 3 and 4 are given in [20] and [16], respectively (see also [49]). The EKR problem for \( L_c \) and \( L_c^{(r)} \) has been widely studied, and several results have been obtained. The EKR-type version of Theorem 4 (that is, the solution to the problem of maximizing the size of an intersecting subfamily of \( L_c \)) is given in [4, 42, 16] (for \( c_1 = c_n \), this is given in a stronger form in [31, 2, 32]). The EKR problem for \( L_c^{(r)} \) has been solved [24, 36, 5]; see [24, 25, 8, 26, 7] for \( c_1 = c_n \), [36] for \( c_1 \geq 2 \), and [5] for \( c_1 = 1 \). The special case \( c_1 = c_n \) of Theorem 4 was treated by Moon [45] (for \( c_1 \geq 3 \)), Tokushige [48] (for \( c_1 \geq 4 \)) and Zhang [51] (for \( c_1 \geq 4 \)) via an induction argument, an eigenvalue method and Katona’s cycle method, respectively. Allowing \( c \) to be increasing appears to be a significant relaxation for the product problem. Our approach is based on the idea of
generalizing the setting enough for induction to work. The setting of Theorem 2 not only allows us to deal with the more general problem for $\mathcal{L}^g$, but also to obtain Theorem 3, where the cross-intersecting families can come from different families.

Our second application of Theorem 2 is a cross-intersection result for multisets.

A multiset is a collection $A$ of objects such that each object possibly appears more than once in $A$. Thus the difference between a multiset and a set is that a multiset may have repetitions of its elements. We can uniquely represent a multiset $A$ once in $A$. We can uniquely represent a multiset by an IP sequence $(a_1, \ldots, a_r)$, where $a_1, \ldots, a_r$ form $A$. Thus we will take multisets to be IP sequences. For $A = (a_1, \ldots, a_r)$, the support of $A$ is the set $\{a_1, \ldots, a_r\}$ and will be denoted by $S_A$; thus, $S_A$ is the set of distinct elements of $A$. For any $n, r \in \mathbb{N}$, let $M_{n,r}$ denote the set of all multisets $(a_1, \ldots, a_r)$ such that $a_1, \ldots, a_r \in [n]$; thus $M_{n,r} = \{(a_1, \ldots, a_r): a_1 \leq \ldots \leq a_r, a_1, \ldots, a_r \in [n]\}$. An elementary counting result is that

$$|M_{n,r}| = \binom{n+r-1}{r}.$$

With a slight abuse of terminology, we say that a multiset $A$ intersects a multiset $B$ if $A$ and $B$ have at least one common element, that is, if $S_A$ intersects $S_B$. A set $\mathcal{A}$ of multisets is said to be intersecting if every two multisets in $\mathcal{A}$ intersect, and $k$ sets $\mathcal{A}_1, \ldots, \mathcal{A}_k$ of multisets are said to be cross-intersecting if for every $i, j \in [k]$ with $i \neq j$, each multiset in $\mathcal{A}_i$ intersects each multiset in $\mathcal{A}_j$.

In Section 5, we prove the following result.

**Theorem 5.** If $r, s \in \mathbb{N}$, $u, v \in \{0\} \cup \mathbb{R}^+$, $u + v \geq 2$, $m \geq (2 + u)(r - 1) + s - 1$, $n \geq (2 + v)(s - 1) + r - 1$, $\mathcal{A} \subseteq M_{m,r}$, $\mathcal{B} \subseteq M_{n,s}$, and $\mathcal{A}$ and $\mathcal{B}$ are cross-intersecting, then

$$|\mathcal{A}||\mathcal{B}| \leq \binom{m + r - 2}{r - 1} \binom{n + s - 2}{s - 1}.$$

Moreover, if $u \neq 0$ and $v \neq 0$, then the bound is attained if and only if for some $a \in [m] \cap [n]$, $\mathcal{A} = \{A \in M_{m,r}: a \in S_A\}$ and $\mathcal{B} = \{B \in M_{n,s}: a \in S_B\}$.

EKR-type results for multisets have been obtained in [44, 34]. To the best of the author’s knowledge, Theorem 5 is the first cross-intersection result for multisets. It is an analogue of the product version in [47, 43] of the EKR Theorem.

As indicated in Section 1, the results above imply EKR-type theorems. In general, if $\mathcal{I} \subseteq \mathcal{F}$, $k \geq 2$, and the sum or the product of sizes of $k$ cross-intersecting subfamilies $\mathcal{A}_1, \ldots, \mathcal{A}_k$ of $\mathcal{F}$ is maximum when $\mathcal{A}_1 = \cdots = \mathcal{A}_k = \mathcal{I}$, then $\mathcal{I}$ is a largest intersecting subfamily of $\mathcal{F}$. Indeed, the cross-intersection condition implies that every two sets $A$ and $B$ in $\mathcal{I}$ intersect (as $A \in \mathcal{A}_1$ and $B \in \mathcal{A}_2$), and by taking an intersecting subfamily $\mathcal{A}$ of $\mathcal{F}$, and setting $\mathcal{B}_1 = \cdots = \mathcal{B}_k = \mathcal{A}$, we obtain that $\mathcal{B}_1, \ldots, \mathcal{B}_k$ are cross-intersecting, and hence $|\mathcal{A}| \leq |\mathcal{I}|$ as $k|\mathcal{A}| = \sum_{i=1}^k |\mathcal{B}_i| \leq \sum_{i=1}^k |\mathcal{A}_i| = k|\mathcal{I}|$ or $|\mathcal{A}|^k = \prod_{i=1}^k |\mathcal{B}_i| \leq \prod_{i=1}^k |\mathcal{A}_i| = |\mathcal{I}|^k$. Similarly, if the sum or the product of weights is maximum when $\mathcal{A}_1 = \cdots = \mathcal{A}_k = \mathcal{I}$, then $\mathcal{I}$ is an intersecting subfamily of $\mathcal{F}$ of maximum weight.

As also indicated in Section 1, the results above generalize for $k \geq 2$ families. For example, applying the line of argument in the proof of [18, Theorem 1.2] to Theorem 2 yields the following generalization of Theorem 2.
Theorem 6. Let $k \geq 2$, $n_1, \ldots, n_k \in \mathbb{N}$, and $u_1, \ldots, u_k \in \{0\} \cup \mathbb{R}^+$ such that $u_i + u_j \geq 2$ for every $i, j \in [k]$ with $i \neq j$. For each $i \in [k]$, let $\emptyset \neq \mathcal{H}_i \subseteq 2^{[n_i]}$ such that $\mathcal{H}_i$ is hereditary and compressed, and let $h_i : \mathcal{H}_i \to \mathbb{R}^+$ be a function such that

(a) $h_i(H) \geq (1 + u_i)h_i(H')$ for every $H, H' \in \mathcal{H}_i$ with $H \subseteq H'$, and

(b) $h_i(\delta_{p,q}(H)) \geq h_i(H)$ for every $H \in \mathcal{H}_i$ and every $p, q \in [n_i]$ with $p < q$.

If $\mathcal{A}_1, \ldots, \mathcal{A}_k$ are cross-intersecting families such that $\mathcal{A}_i \subseteq \mathcal{H}_i$ for each $i \in [k]$, then

$$\prod_{i=1}^{k} h_i(\mathcal{A}_i) \leq \prod_{i=1}^{k} h_i(\mathcal{H}_i(1)).$$

Moreover, equality holds if and only if $\mathcal{A}_i = \mathcal{H}_i(a)$ for some $a \in \min\{n_1, \ldots, n_k\}$ such that $h_i(\mathcal{H}_i(a)) = h_i(\mathcal{H}_i(1))$ for each $i \in [k]$.

We simply observe that $\left(\prod_{i=1}^{k} a_i\right)^{k-1} = \prod_{i=1}^{k-1} \prod_{j \in [k]\setminus[i]} a_i a_j$ and that if $\mathcal{A}_1, \ldots, \mathcal{A}_k$ are cross-intersecting, then any $\mathcal{A}_i$ and $\mathcal{A}_j$ with $i \neq j$ are cross-intersecting. Thus, if, for example, $\mathcal{A}_1, \ldots, \mathcal{A}_k$ are as in Theorem 6, $a_i = h_i(\mathcal{A}_i)$ for each $i \in [k]$, and $b_i = h_i(\mathcal{H}_i(1))$ for each $i \in [k]$, then Theorem 2 gives us $\prod_{i=1}^{k-1} \prod_{j \in [k]\setminus[i]} a_i a_j \leq \prod_{i=1}^{k-1} \prod_{j \in [k]\setminus[i]} b_i b_j$, and hence $\left(\prod_{i=1}^{k} a_i\right)^{k-1} \leq \left(\prod_{i=1}^{k} b_i\right)^{k-1}$ (giving $\prod_{i=1}^{k} a_i \leq \prod_{i=1}^{k} b_i$, as required).

We now start working towards the proofs of Theorems 2, 3, 4 and 5.

### 3 Proof of the main result

This section is dedicated to the proof of Theorem 2.

For the extremal cases, we shall use the following lemma.

Lemma 7. Let $\mathcal{H}$ be a compressed subfamily of $2^{[n]}$, and let $w : \mathcal{H} \to \mathbb{R}^+$ such that $w(\delta_{i,j}(H)) \geq w(H)$ for every $H \in \mathcal{H}$ and every $i, j \in [n]$ with $i < j$. Then $w(\mathcal{H}(a)) \leq w(\mathcal{H}(1))$ for each $a \in [n]$.

Proof. Let $a \in [n]$. Let $\mathcal{D} = \Delta_{1,a}(\mathcal{H}(a))$. Since $\mathcal{H}$ is compressed, $\mathcal{D} \subseteq \mathcal{H}$. Thus it is immediate from the definitions of $\mathcal{D}$ and $w$ that $w(\mathcal{D}) \geq w(\mathcal{H}(a))$. The result follows if we show that $\mathcal{D} \subseteq \mathcal{H}(1)$. Let $\mathcal{D} \subseteq \mathcal{H}(1)$. If $\mathcal{D} \notin \mathcal{H}(a)$, then $\mathcal{D} = \delta_{1,a}(H) \neq H$ for some $H \in \mathcal{H}(a)$, and hence $1 \in \mathcal{D}$. Suppose $\mathcal{D} \in \mathcal{H}(a)$. If we assume that $\delta_{1,a}(\mathcal{D}) \notin \mathcal{H}(a)$, then we obtain $\mathcal{D} \notin \Delta_{1,a}(\mathcal{H}(a))$, contradicting $\mathcal{D} \subseteq \mathcal{D}$. Hence $\delta_{1,a}(\mathcal{D}) \in \mathcal{H}(a)$. Thus, since $a \in \mathcal{D}$ and $a \in \delta_{1,a}(\mathcal{D})$, $1 \in \mathcal{D}$. \qed

We need to use the following well-known properties of compressions. It is straightforward that for $i, j \in [n]$ and $\mathcal{A} \subseteq 2^{[n]}$,

$$|\Delta_{i,j}(\mathcal{A})| = |\mathcal{A}|.$$

Moreover, we have the following.
Lemma 8. Let $\mathcal{A}$ and $\mathcal{B}$ be cross-intersecting subfamilies of $2^{[n]}$.

(i) For any $i, j \in [n]$, $\Delta_{i,j}(\mathcal{A})$ and $\Delta_{i,j}(\mathcal{B})$ are cross-intersecting subfamilies of $2^{[n]}$.

(ii) If $r, s \in [n]$, $\mathcal{A} \subseteq \binom{[n]}{r}$, $\mathcal{B} \subseteq \binom{[n]}{s}$, and $\mathcal{A}$ and $\mathcal{B}$ are compressed, then

$$A \cap B \cap [r+s-1] \neq \emptyset$$

for any $A \in \mathcal{A}$ and any $B \in \mathcal{B}$.

(iii) For some $h \in \mathbb{N}$, there exist $i_1, \ldots, i_h, j_1, \ldots, j_h \in [n]$ such that $i_1 < j_1, \ldots, i_h < j_h$, and $\Delta_{i_h,j_h} \circ \cdots \circ \Delta_{i_1,j_1}(\mathcal{A})$ and $\Delta_{i_h,j_h} \circ \cdots \circ \Delta_{i_1,j_1}(\mathcal{B})$ are cross-intersecting and compressed.

A proof of Lemma 8 is essentially given in [18, Section 2] (see also [30]). The only difference is that in [18], part (ii) is proved for $\mathcal{A} \subseteq \binom{[n]}{r}$ and $\mathcal{B} \subseteq \binom{[n]}{s}$; however, the argument carries forward for $\mathcal{A} \subseteq \binom{[n]}{r}$ and $\mathcal{B} \subseteq \binom{[n]}{s}$.

**Proof of Theorem 2.** We use induction on $m+n$. The basis is $m+n=2$ with $m=n=1$, in which case the result is trivial. Now consider $m+n > 2$. We may assume that $m \leq n$. If $m=1$, then the result is trivial too, so we consider $m \geq 2$. If at least one of $\mathcal{G}$ and $\mathcal{H}$ is $\{\emptyset\}$, then we trivially have $g(\mathcal{A})h(\mathcal{B}) = 0 = g(\mathcal{G}(1))h(\mathcal{H}(1))$. Thus, we will assume that $\mathcal{G} \neq \{\emptyset\}$ and $\mathcal{H} \neq \{\emptyset\}$, meaning that each of $\mathcal{G}$ and $\mathcal{H}$ contain at least one non-empty set. Since $\mathcal{G}$ and $\mathcal{H}$ are hereditary and compressed, we clearly have $\{1\} \in \mathcal{G}$ and $\{1\} \in \mathcal{H}$. So $g(\mathcal{G}(1)) > 0$ and $h(\mathcal{H}(1)) > 0$. Let $\mathcal{A} \subseteq \mathcal{G}$ and $\mathcal{B} \subseteq \mathcal{H}$ such that $g(\mathcal{A})h(\mathcal{B})$ is maximum under the condition that $\mathcal{A}$ and $\mathcal{B}$ are cross-intersecting. Since $\mathcal{G}(1)$ and $\mathcal{H}(1)$ are cross-intersecting, it follows that

$$g(\mathcal{A})h(\mathcal{B}) \geq g(\mathcal{G}(1))h(\mathcal{H}(1)) > 0. \tag{1}$$

We will first show that we may assume that $\mathcal{A}$ and $\mathcal{B}$ are compressed.

By Lemma 8(iii), we can apply left-compressions to $\mathcal{A}$ and $\mathcal{B}$ simultaneously until we obtain two compressed cross-intersecting families $\mathcal{A}^*$ and $\mathcal{B}^*$ such that $|\mathcal{A}^*| = |\mathcal{A}|$ and $|\mathcal{B}^*| = |\mathcal{B}|$. Since $\mathcal{G}$ and $\mathcal{H}$ are compressed, $\mathcal{A}^* \subseteq \mathcal{G}$ and $\mathcal{B}^* \subseteq \mathcal{H}$. From (b) we obtain $g(\mathcal{A}) \leq g(\mathcal{A}^*)$ and $h(\mathcal{B}) \leq h(\mathcal{B}^*)$. By the choice of $\mathcal{A}$ and $\mathcal{B}$, we actually have $g(\mathcal{A}) = g(\mathcal{A}^*)$ and $h(\mathcal{B}) = h(\mathcal{B}^*)$.

We now show that we may also work with $\mathcal{A}^*$ and $\mathcal{B}^*$ for the purpose of establishing the second part of the theorem (that is, the characterization of the extremal structures for $u \neq 0 \neq v$). Suppose that $\mathcal{A}^* = \mathcal{G}(c)$ and $\mathcal{B}^* = \mathcal{H}(c)$ for some $c \in [m] \cap [n]$ such that $g(\mathcal{G}(c)) = g(\mathcal{G}(1))$ and $h(\mathcal{H}(c)) = h(\mathcal{H}(1))$. Then $g(\mathcal{G}(c)) > 0$ and $h(\mathcal{H}(c)) > 0$. So $\mathcal{G}(c) \neq \emptyset$ and $\mathcal{H}(c) \neq \emptyset$. Thus, since $\mathcal{G}$ and $\mathcal{H}$ are hereditary, $\{c\} \in \mathcal{A}^*$ and $\{c\} \in \mathcal{B}^*$. So $\{a\} \in \mathcal{A}$ for some $a \in [m]$, and $\{b\} \in \mathcal{B}$ for some $b \in [n]$. Since $\mathcal{A}$ and $\mathcal{B}$ are cross-intersecting, we have $a = b$, $\mathcal{A} \subseteq \mathcal{G}(a)$ and $\mathcal{B} \subseteq \mathcal{H}(a)$. Since $\mathcal{G}(a)$ and $\mathcal{H}(a)$ are cross-intersecting, it follows by the choice of $\mathcal{A}$ and $\mathcal{B}$ that $\mathcal{A} = \mathcal{G}(a)$, $\mathcal{B} = \mathcal{H}(a)$, and $g(\mathcal{G}(a))h(\mathcal{H}(a)) \geq g(\mathcal{G}(1))h(\mathcal{H}(1))$. Since Lemma 7 gives us $g(\mathcal{G}(a)) \leq g(\mathcal{G}(1))$ and $h(\mathcal{H}(a)) \leq h(\mathcal{H}(1))$, it follows that we actually have $g(\mathcal{G}(a))h(\mathcal{H}(a)) = g(\mathcal{G}(1))h(\mathcal{H}(1))$, $g(\mathcal{G}(a)) = g(\mathcal{G}(1))$ and $h(\mathcal{H}(a)) = h(\mathcal{H}(1))$.

Therefore, we may (and will) assume that $\mathcal{A}$ and $\mathcal{B}$ are compressed.
Define $\mathcal{H}_0 = \{H \in \mathcal{H} : n \notin H\}$ and $\mathcal{H}_1 = \{H \setminus \{n\} : n \in H \in \mathcal{H}\}$. Define $\mathcal{G}_0$, $\mathcal{G}_1$, $\mathcal{A}_0$, $\mathcal{A}_1$, $\mathcal{B}_0$ and $\mathcal{B}_1$ similarly. Since $\mathcal{A}$, $\mathcal{B}$, $\mathcal{G}$ and $\mathcal{H}$ are compressed, we clearly have that $\mathcal{A}_0$, $\mathcal{A}_1$, $\mathcal{B}_0$, $\mathcal{B}_1$, $\mathcal{G}_0$, $\mathcal{G}_1$, $\mathcal{H}_0$ and $\mathcal{H}_1$ are compressed. Since $\mathcal{G}$ and $\mathcal{H}$ are hereditary, we clearly have that $\mathcal{G}_0$, $\mathcal{G}_1$, $\mathcal{H}_0$ and $\mathcal{H}_1$ are hereditary, $\mathcal{G}_1 \subseteq \mathcal{G}_0$ and $\mathcal{H}_1 \subseteq \mathcal{H}_0$. If $\mathcal{G}_1 = \emptyset$, then $\mathcal{G} \subseteq 2^{[m-1]}$, and hence we obtain the result immediately from the induction hypothesis.

The same occurs if $\mathcal{H}_1 = \emptyset$. So we assume that $\mathcal{G}_1$ and $\mathcal{H}_1$ are non-empty. Since $\mathcal{G}_1 \subseteq \mathcal{G}_0$ and $\mathcal{H}_1 \subseteq \mathcal{H}_0$, $\mathcal{G}_0$ and $\mathcal{H}_0$ are non-empty too. Obviously, we have $\mathcal{A}_0 \subseteq \mathcal{G}_0 \subseteq 2^{[m-1]}$, $\mathcal{A}_1 \subseteq \mathcal{G}_1 \subseteq 2^{[m-1]}$, $\mathcal{B}_0 \subseteq \mathcal{H}_0 \subseteq 2^{[n-1]}$ and $\mathcal{B}_1 \subseteq \mathcal{H}_1 \subseteq 2^{[n-1]}$.

Let $h_0 : \mathcal{H}_0 \to \mathbb{R}^+$ such that $h_0(H) = h(H)$ for each $H \in \mathcal{H}_0$. Let $h_1 : \mathcal{H}_1 \to \mathbb{R}^+$ such that $h_1(H) = h(H \cup \{n\})$ for each $H \in \mathcal{H}_1$ (note that $H \cup \{n\} \in \mathcal{H}(n)$ by definition of $\mathcal{H}_1$). By (b) and (d), we have the following consequences. For any $A, B \in \mathcal{H}_0$ with $\emptyset \neq A \subset B$,

$$h_0(A) = h(A) \geq (1 + v)h(B) = (1 + v)h_0(B).$$  \hfill (2)

For any $C \in \mathcal{H}_0$ and any $i, j \in [n - 1]$ with $i < j$,

$$h_0(\delta_{i,j}(C)) = h(\delta_{i,j}(C)) \geq h(C) = h_0(C).$$  \hfill (3)

For any $A, B \in \mathcal{H}_1$ with $\emptyset \neq A \subset B$,

$$h_1(A) = h(A \cup \{n\}) \geq (1 + v)h(B \cup \{n\}) = (1 + v)h_1(B).$$  \hfill (4)

For any $C \in \mathcal{H}_1$ and any $i, j \in [n - 1]$ with $i < j$,

$$h_1(\delta_{i,j}(C)) = h(\delta_{i,j}(C) \cup \{n\}) = h(\delta_{i,j}(C \cup \{n\})) \geq h(C \cup \{n\}) = h_1(C).$$  \hfill (5)

Thus, we have shown that properties (b) and (d) are inherited by $h_0$ and $h_1$.

Since $B = B_0 \cup B(n)$, $B_0 \cap B(n) = \emptyset$ and $B(n) = \{B \cup \{n\} : B \in \mathcal{B}_1\}$, we have

$$h(B) = h(B_0) + h(B(n)) = h_0(B_0) + h_1(B_1).$$  \hfill (6)

Along the same lines,

$$h(\mathcal{H}(1)) = h(\mathcal{H}_0(1)) + h(\{H \in \mathcal{H} : 1, n \in H\})$$

$$= h_0(\mathcal{H}_0(1)) + h(\{H \cup \{n\} : H \in \mathcal{H}_1(1)\})$$

$$= h_0(\mathcal{H}_0(1)) + h_1(\mathcal{H}_1(1)).$$  \hfill (7)

Suppose $m < n$. Clearly, $\mathcal{A}$ and $\mathcal{B}_0$ are cross-intersecting. Since $m < n$, no set in $\mathcal{A}$ contains $n$, and hence $\mathcal{A}$ and $\mathcal{B}_1$ are cross-intersecting. Thus, by the induction hypothesis,

$$g(\mathcal{A})h_j(B_j) \leq g(\mathcal{G}(1))h_j(\mathcal{H}_j(1)) \quad \text{for each } j \in \{0, 1\}. \hfill (8)$$

Together with (6) and (7), this gives us

$$g(\mathcal{A})h(B) = g(\mathcal{A})h_0(B_0) + g(\mathcal{A})h_1(B_1)$$

$$\leq g(\mathcal{G}(1))h_0(\mathcal{H}_0(1)) + g(\mathcal{G}(1))h_1(\mathcal{H}_1(1))$$

$$= g(\mathcal{G}(1))h(\mathcal{H}(1)).$$  \hfill (9)
This establishes the first part of the theorem for \( m < n \), and we now verify the second part for this case. By (1), equality holds throughout in (9). Thus, in (8), we actually have equality. Suppose \( u \neq 0 \) and \( v \neq 0 \). Then, by the induction hypothesis, for each \( j \in \{0, 1\} \) we have \( A = G(a_j) \) and \( B_j = H_j(a_j) \) for some \( a_j \in [m] \) such that \( g(G(a_j)) = g(G(1)) \) and \( h_j(H_j(a_j)) = h_j(H_j(1)) \). So \( g(G(a_0)) > 0 \), and hence \( G(a_0) \neq \emptyset \). Thus, since \( G \) is hereditary, \( \{a_0\} \in A \). Since \( A \) and \( B \) are cross-intersecting, \( B \subseteq H(a_0) \). Since \( G(a_0) \) and \( H(a_0) \) are cross-intersecting, it follows by the choice of \( A \) and \( B \) that \( A = G(a_0) \) and \( B = H(a_0) \). Thus, since \( g(A)h(B) = g(G(1))h(H(1)) \), and since Lemma 7 gives us \( g(G(a_0)) \leq g(G(1)) \) and \( h(H(a_0)) \leq h(H(1)) \), we have \( g(G(a_0)) = g(G(1)) \) and \( h(H(a_0)) = h(H(1)) \).

Now suppose \( m = n \). Similarly to \( h_0 \) and \( h_1 \), let \( g_0 : G_0 \to \mathbb{R}^+ \) such that \( g_0(G) = g(G) \) for each \( G \in G_0 \), and let \( g_1 : G_1 \to \mathbb{R}^+ \) such that \( g_1(G) = g(G \cup \{n\}) \) for each \( G \in G_1 \) (note that, since \( m = n \), \( G \cup \{n\} \in G(n) \) by definition of \( G_i \)). Then properties (a) and (c) are inherited by \( g_0 \) and \( g_1 \) in the same way (b) and (d) are inherited by \( h_0 \) and \( h_1 \) as shown above; that is, similarly to (2)–(5), we have the following. For any \( A, B \in G_0 \) with \( \emptyset \neq A \subseteq B \),
\[
g_0(A) \geq (1 + u)g_0(B). \tag{10}
\]
For any \( C \in G_0 \) and any \( i, j \in [n - 1] \) with \( i < j \),
\[
g_0(\delta_{i,j}(C)) \geq g_0(C). \tag{11}
\]
For any \( A, B \in G_1 \) with \( \emptyset \neq A \subseteq B \),
\[
g_1(A) \geq (1 + u)g_1(B). \tag{12}
\]
For any \( C \in G_1 \) and any \( i, j \in [n - 1] \) with \( i < j \),
\[
g_1(\delta_{i,j}(C)) \geq g_1(C). \tag{13}
\]

Similarly to (6) and (7), we have
\[
g(A) = g_0(A_0) + g_1(A_1), \tag{14}
\]
\[
g(G(1)) = g_0(G_0(1)) + g_1(G_1(1)). \tag{15}
\]

Clearly, \( A_0 \) and \( B_0 \) are cross-intersecting, and, since \( n = m \), so are \( A_0 \) and \( B_1 \), and also \( A_1 \) and \( B_0 \).

Let us first assume that \( A_1 \) and \( B_1 \) are cross-intersecting too. Then, by the induction hypothesis,
\[
g_i(A_i)h_j(B_j) \leq g_i(G_i(1))h_j(H_j(1)) \quad \text{for any } i, j \in \{0, 1\}. \tag{16}
\]
Together with (6), (7), (14) and (15), this gives us
\[
g(A)h(B) = g_0(A_0)h_0(B_0) + g_0(A_0)h_1(B_1) + g_1(A_1)h_0(B_0) + g_1(A_1)h_1(B_1) \\
\leq g_0(G_0(1))h_0(H_0(1)) + g_0(G_0(1))h_1(H_1(1)) + g_1(G_1(1))h_0(H_0(1)) + g_1(G_1(1))h_1(H_1(1)) \\
= g(G(1))h(H(1)).
\]
By (1), equality holds throughout, and hence $g(A)h(B) = g(G(1))h(H(1))$. So in (16) we actually have equality. Suppose $u \neq 0 \neq v$. By the induction hypothesis, we particularly have $A_0 = G_0(a_0)$ and $B_0 = H_0(a_0)$ for some $a_0 \in [n - 1]$ such that $g_0(G_0(a_0)) = g_0(G_0(1))$ and $h_0(H_0(a_0)) = h_0(H_0(1))$. Recall that $\{1\} \in G$. So $\{1\} \in G_0$, and hence $g_0(G_0(1)) > 0$. So $g_0(G_0(a_0)) > 0$, and hence $G_0(a_0) \neq \emptyset$. Thus, since $G$ is hereditary, $\{a_0\} \in A$. Since $A_0$ and $B$ are cross-intersecting, $B \subseteq H(a_0)$. Similarly, we obtain $A \subseteq G(a_0)$. As in the case $m < n$, we conclude that $A = G(a_0)$, $B = H(a_0)$, $g(G(a_0)) = g(G(1))$ and $h(H(a_0)) = h(H(1))$. 

Suppose that $A_1$ and $B_1$ are not cross-intersecting. Then there exists $A_1 \in A_1$ such that $A_1 \cap B = \emptyset$ for some $B \in B_1$. Let $B_1 = [n - 1]\backslash A_1$, $A_1' = A_1 \cup \{n\}$, $B_1' = B_1 \cup \{n\}$. Since $A_1 \in A_1$, $A_1' \in A$.

If $A_1 = [n - 1]$, then $B = B_1$. Suppose $A_1 \neq [n - 1]$ and $B \neq B_1$. Then $B \not\subseteq [n - 1]\backslash A_1$, and hence $[n - 1]\backslash (A_1 \cup B) \neq \emptyset$. Let $c \in [n - 1]\backslash (A_1 \cup B)$.

Since $B \subseteq B_1$, $B \cup \{n\} \subseteq B$. Let $C = \delta_{c,n}(B \cup \{n\})$. Since $c \notin B \cup \{n\}$, $C = B \cup \{c\}$. Since $B$ is compressed, $C \in B$. However, since $c \notin A_1'$ and $A_1 \cap B = \emptyset$, we have $A_1' \cap C = \emptyset$, which is a contradiction as $A$ and $B$ are cross-intersecting.

We have therefore shown that

$B_1$ is the unique set in $B_1$ that does not intersect $A_1$.  

By a similar argument,

$A_1$ is the unique set in $A_1$ that does not intersect $B_1$.  

Since $B_1 \in B_1$, $B_1' \in B$. Since $A$ and $B$ are compressed,

$$δ_{p,n}(A_1') \in A \quad \text{and} \quad δ_{p,n}(B_1') \in B \quad \text{for each} \quad p \in [n - 1].$$

Since $A_1 \cap B_1' = A_1 \cap B_1 = \emptyset$ and $B_1 \cap A_1' = B_1 \cap A_1 = \emptyset$, we have $A_1 \notin A$ and $B_1 \notin B$. Let $A' = A \cup \{A_1\}$, $A'' = A \backslash \{A_1\}$, $B' = B \cup \{B_1\}$, $B'' = B \cup \{B_1\}$. By (17), $A'$ and $B'$ are cross-intersecting. By (18), $A''$ and $B''$ are cross-intersecting. Since $G$ and $H$ are hereditary, and since $A_1' \in A \subseteq G$ and $B_1' \in B \subseteq H$, we have $A_1 \in G$ and $B_1 \in H$, and hence $A', A'' \subseteq G$ and $B', B'' \subseteq H$.

Let $x = g(A)$ and $x_1 = g(A_1')$. Let $y = h(B)$ and $y_1 = h(B_1')$. We have

$$g(A') = x + g(A_1) \geq x + (1 + u)g(A_1') = x + (1 + u)x_1,$$

$$g(A'') = x - g(A_1') = x - x_1,$$

$$h(B') = y - h(B_1') = y - y_1,$$

$$h(B'') = y + h(B_1) \geq y + (1 + v)h(B_1') = y + (1 + v)y_1.$$  

By the choice of $A$ and $B$,

$$g(A')h(B') \leq g(A)h(B) \quad \text{and} \quad g(A'')h(B'') \leq g(A)h(B).$$

So we have
(x + (1 + u)x_1)(y - y_1) \leq xy \quad \text{and} \quad (x - x_1)(y + (1 + v)y_1) \leq xy \\
\Rightarrow (1 + u)x_1y \leq xy_1 + (1 + u)x_1y_1 \quad \text{and} \quad (1 + v)xy_1 \leq x_1y + (1 + v)x_1y_1 \\
\Rightarrow (1 + u)x_1y + (1 + v)xy_1 \leq (xy_1 + (1 + u)x_1y_1) + (x_1y + (1 + v)x_1y_1) \\
\Rightarrow ux_1y + vxy_1 \leq (2 + u + v)x_1y_1. \quad (20)

Suppose \( A_1 \neq \emptyset \) and \( B_1 \neq \emptyset \). It follows by definition of \( B_1 \) that \( [n - 1] \setminus A_1 \neq \emptyset \) and \( [n - 1] \setminus B_1 \neq \emptyset \). Let \( a \in [n - 1] \setminus A_1 \) and \( b \in [n - 1] \setminus B_1 \). Let \( A''_1 = \delta_{a,n}(A_1') \) and \( B''_1 = \delta_{b,n}(B_1') \). So \( A''_1 \neq A_1' \) and \( B''_1 \neq B_1' \). By (19), \( A''_1 \in \mathcal{A} \) and \( B''_1 \in \mathcal{B} \). By (b), \( g(A''_1) \geq g(A_1') \) and \( h(B''_1) \geq h(B_1') \). We therefore have \( x \geq x_1 + g(A''_1) \geq 2x_1 \) and \( y \geq y_1 + h(B''_1) \geq 2y_1 \). By (20), we have

\[
(2 + u + v)x_1y_1 \geq ux_1y + vxy_1 \geq ux_1(2y_1) + v(2x_1)y_1 \\
= (2 + 2v)x_1y_1 \geq (2 + u + v)x_1y_1
\]

(since we are given that \( u + v \geq 2 \)), and hence equality holds throughout. Thus \( x = 2x_1 \) and \( y = 2y_1 \). Consequently, we have \( \mathcal{A} = \{ A_1', A''_1 \} \), \( \mathcal{B} = \{ B'_1, B''_1 \} \), \( g(A''_1) = g(A_1') \) and \( h(B''_1) = h(B_1') \). Let \( A_2 = [A_1'[, B_2 = [B'_1[ \) and \( I = \{ 1 \} \). Since \( \mathcal{G} \) is compressed and \( A_1' \in \mathcal{A} \subset \mathcal{G} \), \( A_2 \in \mathcal{G} \) and \( g(A_2) \geq g(A_1') \). Similarly, \( B_2 \in \mathcal{H} \) and \( h(B_2) \geq h(B_1') \). Since \( A_1 \neq \emptyset \), we have \( |A_1'| \geq 2 \), and hence \( |A_2| \geq 2 \). Since \( \mathcal{G} \) is hereditary and \( I \subset A_2 \subset \mathcal{G} \), \( I \in \mathcal{G} \) and \( g(I) \geq (1 + u)g(A_2) \). Similarly, \( I \in \mathcal{H} \) and \( h(I) \geq (1 + v)h(B_2) \). Let \( C = \{ I, A_2 \} \) and \( D = \{ I, B_2 \} \). So \( C \subseteq \mathcal{G} \) and \( D \subseteq \mathcal{H} \). Also, \( C \) and \( D \) are cross-intersecting. We have

\[
g(C)h(D) = (g(I) + g(A_2))(h(I) + h(B_2)) \\
\geq ((2 + u)g(A_2))(2 + v)h(B_2)) \geq (2 + u)(2 + v)g(A_1')h(B_1') \\
= (2 + u)(2 + v)x_1y_1 = (2 + u)(2 + v)\frac{xy}{2} \\
> xy = g(A)h(B) \quad \text{(since } u + v \geq 2, \ u \geq 0, \ \text{and } v \geq 0),
\]

which contradicts the choice of \( \mathcal{A} \) and \( \mathcal{B} \).

Therefore, \( A_1 = \emptyset \) or \( B_1 = \emptyset \).

Suppose \( A_1 = \emptyset \). Then \( A'_1 = \{ n \} \) and \( B'_1 = [n] \). By (19), the sets \( \{ 1 \}, \ldots, \{ n \} \) are all in \( \mathcal{A} \), and obviously no proper subset of \( [n] \) intersects each of these sets. Thus, by the cross-intersection condition, \( B'_1 \) is the only set that is in \( \mathcal{B} \). So

\[
h(B'') = h(B'_1) = h(B_1') + (1 + v)h(B'_1) = (2 + v)h(B'_1) = (2 + v)h(B).
\]

Since \( \{ 1 \}, \ldots, \{ n \} \in \mathcal{A} \) and \( A'_1 = \{ n \} \), we have

\[
ng(A'_1) \leq g(A'_1) + \sum_{p=1}^{n-1} g(\delta_{p,n}(A'_1)) = \sum_{p=1}^{n} g(\{ p \}) \leq g(\mathcal{A}), \quad (21)
\]

and hence \( g(A'_1) \leq g(\mathcal{A})/n \). Since \( g(A'') = g(\mathcal{A}) - g(A'_1) \), \( g(A'') \geq \frac{n-1}{n} g(\mathcal{A}) \). Thus \( g(\mathcal{A}'') h(B'') \geq \frac{n-1}{n} g(\mathcal{A})(2 + v)h(B) \geq g(\mathcal{A})h(B) \). Since \( g(\mathcal{A}'') h(B'') \leq g(\mathcal{A})h(B) \) (by the
4 Proofs of Theorems 3 and 4

In this section, we use Theorem 2 to prove Theorems 3 and 4. Recall that for any IP sequence $c = (c_1, \ldots, c_n)$ and any $r \in [n]$, $L^{(r)}_c$ denotes the family

\[
\left\{ \{(x_1, y_{x_1}), \ldots, (x_r, y_{x_r})\} : \{x_1, \ldots, x_r\} \subseteq \left[\begin{array}{c}n \\ r \end{array}\right], y_{x_j} \in [c_{x_j}] \text{ for each } j \in [r] \right\}.
\]

Let $L^{(\leq r)}_c$ denote the union $\bigcup_{i=1}^r L^{(i)}_c$.

We start by defining a compression operation for labeled sets. For any $x, y \in \mathbb{N}$, let

\[
\gamma_{x,y}(A) = \left\{ \begin{array}{ll}
(A \setminus \{(x, y)\}) \cup \{(x, 1)\} & \text{if } (x, y) \in A; \\
A & \text{otherwise}
\end{array} \right.
\]

for any labeled set $A$, and let

\[
\Gamma_{x,y}(A) = \{\gamma_{x,y}(A) : A \in A, \gamma_{x,y}(A) \notin A\} \cup \{A \in A : \gamma_{x,y}(A) \in A\}
\]

for any family $A$ of labeled sets.

Note that $|\Gamma_{x,y}(A)| = |A|$ and that if $A \subseteq L^{(r)}_c$, then $\Gamma_{x,y}(A) \subseteq L^{(r)}_c$. It is easy to check that if $A$ and $B$ are cross-intersecting families of labeled sets, then so are $\Gamma_{x,y}(A)$ and $\Gamma_{x,y}(B)$. We prove more than this.

**Lemma 9.** Let $c = (c_1, \ldots, c_m)$ and $d = (d_1, \ldots, d_n)$ be IP sequences. Let $x, y \in \mathbb{N}$, $y \geq 2$. Let $l = \max\{m, n\}$ and $h = \max\{c_m, d_n\}$. Let $V \subseteq [l] \times [2, h]$. Let $A \subseteq L^{(\leq m)}_c$ and $B \subseteq L^{(\leq n)}_d$ such that $(A \cap B) \setminus V \neq \emptyset$ for every $A \in A$ and every $B \in B$. Then $(C \cap D) \setminus (V \cup \{(x, y)\}) \neq \emptyset$ for every $C \in \Gamma_{x,y}(A)$ and every $D \in \Gamma_{x,y}(B)$.

**Proof.** Let $C \in \Gamma_{x,y}(A)$ and $D \in \Gamma_{x,y}(B)$. We first show that $(C \cap D) \setminus V \neq \emptyset$. Let $C' = (C \setminus \{(x, 1)\}) \cup \{(x, y)\}$. If $C \in A$ and $D \in B$, then $(C \cap D) \setminus V \neq \emptyset$. If $C \notin A$ and $D \notin B$, then $(x, 1)$ is in both $C$ and $D$, and hence, since $(x, 1) \notin V$, $(x, 1) \in (C \cap D) \setminus V$. Suppose $C \notin A$ and $D \in B$. So $(x, 1) \in C$ and $C' \in A$. If $(x, y) \notin D$, then, since $C' \in A$ and $D \in B$, $0 < |(C' \cap D) \setminus V| \leq |(C \cap D) \setminus V|$. If $(x, y) \in D$, then $\gamma_{x,y}(D) \in B$ (because otherwise $D \notin \Gamma_{x,y}(B)$), and hence, since $C' \in A$, $0 < |(C' \cap \gamma_{x,y}(D)) \setminus V| = |(C \cap D) \setminus V|$. Similarly, if $C \in A$ and $D \notin B$, then $(C \cap D) \setminus V \neq \emptyset$.

Now suppose $(C \cap D) \setminus (V \cup \{(x, y)\}) = \emptyset$. Since $(C \cap D) \setminus V \neq \emptyset$, $(x, y) \in C \cap D$. So $C, \gamma_{x,y}(C) \in A$, $D, \gamma_{x,y}(D) \in B$ and $|(C \cap D) \setminus (V \cup \{(x, y)\})| \neq 0$, a contradiction.
Corollary 10. Let $c = (c_1, \ldots, c_m), d = (d_1, \ldots, d_n), h$ and $l$ be as in Lemma 9. Let $\mathcal{A} \subseteq \mathcal{L}_c^{(\infty)}$ and $\mathcal{B} \subseteq \mathcal{L}_d^{(\infty)}$ such that $\mathcal{A}$ and $\mathcal{B}$ are cross-intersecting. Let 

$$\mathcal{A}^* = \Gamma_{l,h} \circ \cdots \circ \Gamma_{l,2} \circ \cdots \circ \Gamma_{2,h} \circ \cdots \circ \Gamma_{1,h} \circ \cdots \circ \Gamma_{1,2}(\mathcal{A}),$$

$$\mathcal{B}^* = \Gamma_{l,h} \circ \cdots \circ \Gamma_{l,2} \circ \cdots \circ \Gamma_{2,h} \circ \cdots \circ \Gamma_{1,h} \circ \cdots \circ \Gamma_{1,2}(\mathcal{B}).$$

Then $A \cap B \cap ([l] \times [1]) \neq \emptyset$ for any $A \in \mathcal{A}^*$ and any $B \in \mathcal{B}^*$.

Proof. Let $Z = [l] \times [2, h]$. By repeated application of Lemma 9 (starting with $V = \emptyset$), $(A \cap B) \setminus Z \neq \emptyset$ for any $A \in \mathcal{A}^*$ and any $B \in \mathcal{B}^*$. The result follows since $(A \cap B) \setminus Z = A \cap B \cap ([l] \times [1]).$ \qed

The next lemma is needed for the characterization of the extremal structures in Theorems 3 and 4.

Lemma 11. Let $c = (c_1, \ldots, c_m), d = (d_1, \ldots, d_n), h$ and $l$ be as in Lemma 9. Suppose $c_1 \geq 2, d_1 \geq 2$ and $c_1 + d_1 \geq 5$. Let $r \in [m]$ and $s \in [n]$. Let $\mathcal{A} \subseteq \mathcal{L}_c^{(r)}$ and $\mathcal{B} \subseteq \mathcal{L}_d^{(s)}$ such that $\mathcal{A}$ and $\mathcal{B}$ are cross-intersecting. Suppose $\Gamma_{x,y}(\mathcal{A}) = \mathcal{L}_c^{(r)}((u, v))$ and $\Gamma_{x,y}(\mathcal{B}) = \mathcal{L}_d^{(s)}((u, v))$ for some $(x, y), (u, v) \in [l] \times [h]$. Then $\mathcal{A} = \mathcal{L}_c^{(r)}((w, z))$ and $\mathcal{B} = \mathcal{L}_d^{(s)}((w, z))$ for some $(w, z) \in [l] \times [h]$.

Proof. Since $c_1 + d_1 \geq 5$, we have $c_1 \geq 3$ or $d_1 \geq 3$. We may assume that $c_1 \geq 3$.

Suppose $\mathcal{A} = \Gamma_{x,y}(\mathcal{A})$. Then $\mathcal{A} = \mathcal{L}_c^{(r)}((u, v))$. Clearly, for each $B \in \mathcal{L}_d^{(s)}$ with $(u, v) \notin B$, there exists a set in $\mathcal{L}_c^{(r)}((u, v))$ that does not intersect $B$. Thus $\mathcal{B} \subseteq \mathcal{L}_d^{(s)}((u, v))$. Since $\Gamma_{x,y}(\mathcal{B}) = \mathcal{L}_c^{(r)}((u, v))$, it follows that $\mathcal{B} = \mathcal{L}_d^{(s)}((u, v))$.

Now suppose $\mathcal{A} \neq \Gamma_{x,y}(\mathcal{A})$. So there exists $A_1 \in \mathcal{A} \setminus \Gamma_{x,y}(\mathcal{A})$ such that $\gamma_{x,y}(A_1) \in \Gamma_{x,y}(\mathcal{A}) \setminus \mathcal{A}$. Let $A'_1 = \gamma_{x,y}(A_1)$. Thus $(x, y) \in A_1$ and $(u, v) \in A'_1 = (A_1 \setminus \{(x, y)\}) \cup \{(x, 1)\}$.

Suppose that $(u, v) \neq (x, 1)$. Then $(u, v) \in A_1$. So $A_1 \in \mathcal{L}_c^{(r)}((u, v))$, and hence $A_1 \in \Gamma_{x,y}(\mathcal{A})$, a contradiction.

Therefore, $(u, v) = (x, 1)$. Since $A_1 \neq A'_1$, $(x, y) \neq (x, 1)$.

Let $A^* \in \mathcal{L}_c^{(r)}((x, y))$. Let $x_1, \ldots, x_{s-1}$ be distinct elements of $[n] \setminus \{x\}$. For each $i \in [n]$, let $D_i = \{i\} \times [d_i]$. We are given that $3 \leq d_1 \leq \ldots \leq d_n$. By definition of a labeled set, for each $i \in [n]$ we have $|A \cap D_i| \leq 1$ for all $A \in \mathcal{L}_c^{(r)}$. Thus, $|D_i \setminus (A_1 \cup A^*)| \geq d_i - 2 \geq 1$ for each $i \in [n]$. For each $i \in [s-1]$, let $y_i \in D_i \setminus (A_1 \cup A^*)$. Let $B^* = \{(x, y), (x_1, y_1), \ldots, (x_{s-1}, y_{s-1})\}$. So $B^* \in \mathcal{L}_d^{(s)}((x, y))$. Since $\Gamma_{x,y}(\mathcal{B}) = \mathcal{L}_d^{(s)}((x, 1))$, either $B^* \in \mathcal{B}$ or $\gamma_{x,y}(B^*) \in \mathcal{B}$. However, $\gamma_{x,y}(B^*) \cap A_1 = \emptyset$. So $B^* \in \mathcal{B}$. Since $\Gamma_{x,y}(\mathcal{A}) = \mathcal{L}_c^{(r)}((x, 1))$, either $A^* \in \mathcal{A}$ or $\gamma_{x,y}(A^*) \in \mathcal{A}$. However, $\gamma_{x,y}(A^*) \cap B^* = \emptyset$. So $A^* \in \mathcal{A}$.

We have therefore shown that $\mathcal{L}_c^{(r)}((x, y)) \subseteq \mathcal{A}$ (when $\mathcal{A} \neq \Gamma_{x,y}(\mathcal{A})$). Since $|\Gamma_{x,y}(\mathcal{A})| = |\mathcal{L}_c^{(r)}((x, 1))| = |\mathcal{L}_c^{(r)}((x, y))|$, we actually have $\mathcal{A} = \mathcal{L}_c^{(r)}((x, y))$. As above, it follows that $\mathcal{B} \subseteq \mathcal{L}_d^{(s)}((x, y))$. Since $|\Gamma_{x,y}(\mathcal{B})| = |\mathcal{L}_d^{(s)}((x, 1))| = |\mathcal{L}_d^{(s)}((x, y))|$, $\mathcal{B} = \mathcal{L}_d^{(s)}((x, y))$. \qed

THE ELECTRONIC JOURNAL OF COMBINATORICS 23(4) (2014), #P4.45

14
Lemma 12. Let $c$ be an IP sequence $(c_1, \ldots, c_n)$ and let $r \in [n]$. Let $w : \binom{[n]}{\leq r} \to \mathbb{N}$ such that for each $A \in \binom{[n]}{\leq r}$,

$$w(A) = \left| \left\{ L \in \mathcal{L}_{c}^{(r)} : L \cap ([n] \times [1]) = A \times [1] \right\} \right| .$$

Then:

(i) $w(A) \geq (c_1 - 1)w(A')$ for any $A, A' \in \binom{[n]}{\leq r}$ with $A \subseteq A'$.

(ii) $w(\delta_{i,j}(A)) \geq w(A)$ for any $A \in \binom{[n]}{\leq r}$ and any $i, j \in [n]$ with $i < j$.

Proof. (i) Let $A, A' \in \binom{[n]}{\leq r}$ with $A \subseteq A'$. Let $B = A' \setminus A$. So $|B| \geq 1$. For each $L \in \mathcal{L}_{c}^{(r)}$, let $\sigma(L) = \{ i \in [n] : (i, a) \in L \text{ for some } a \in [c_i] \}$. We have

$$w(A) \geq \left| \left\{ L \in \mathcal{L}_{c}^{(r)} : L \cap ([n] \times [1]) = A \times [1], B \subset \sigma(L) \right\} \right|$$

$$= \sum_{E \in \binom{[n]}{\leq r} \setminus \binom{A \cup \{j\}}{\leq r-|A|}} \prod_{b \in B} (c_b - 1) \prod_{e \in E} (c_e - 1) = \prod_{b \in B} (c_b - 1) \left( \sum_{E \in \binom{[n]}{\leq r} \setminus \binom{A'}{\leq r-|A'|}} \prod_{e \in E} (c_e - 1) \right)$$

$$= w(A') \prod_{b \in B} (c_b - 1) \geq (c_1 - 1)^{|B|}w(A') \geq (c_1 - 1)w(A').$$

(ii) Let $A \in \binom{[n]}{\leq r}$, and let $i, j \in [n]$ with $i < j$. Suppose $\delta_{i,j}(A) \neq A$. Then $j \in A$, $i \notin A$ and $\delta_{i,j}(A) = (A \setminus \{j\}) \cup \{i\}$. Let $B = A \setminus \{j\}$, $E_0 = \binom{[n] \setminus (B \cup \{i\})}{r-|A|}$, $E_1 = \left\{ E \in \binom{[n] \setminus (B \cup \{i\})}{r-|A|} : j \in E \right\}$, $E_2 = \left\{ E \in \binom{[n] \setminus (B \cup \{j\})}{r-|A|} : i \in E \right\}$. We have

$$w(B \cup \{j\}) = \sum_{E \in \binom{[n] \setminus (B \cup \{i\})}{r-|A|}} \prod_{e \in E} (c_e - 1) = \sum_{D \in E_0} \prod_{d \in D} (c_d - 1) + \sum_{F \in E_1} \prod_{f \in F} (c_f - 1) + \sum_{F \in E_2} \prod_{f \in F} (c_f - 1) \geq \sum_{D \in E_0} \prod_{d \in D} (c_d - 1) + \sum_{F \in E_1} \prod_{f \in F} (c_f - 1) \frac{c_i - 1}{c_j - 1}$$

$$(\text{since } c_i \leq c_j)$$

$$= \sum_{D \in E_0} \prod_{d \in D} (c_d - 1) + \sum_{F \in E_2} \prod_{f \in F} (c_f - 1) = \sum_{E \in \binom{[n] \setminus (B \cup \{j\})}{r-|A|}} \prod_{e \in E} (c_e - 1)$$

$$= w(B \cup \{j\}),$$

and hence $w(\delta_{i,j}(A)) \geq w(A)$.

We now prove Theorem 3, and then we prove Theorem 4.

Proof of Theorem 3. Let $\mathcal{X} = \{ X \in \mathcal{L}_{c}^{(r)} : (1, 1) \in X \}$ and $\mathcal{Y} = \{ Y \in \mathcal{L}_{d}^{(s)} : (1, 1) \in Y \}$. Note that $|\mathcal{X}| = \sum_{I \in \binom{[s]}{\leq r}} \prod_{i \in I} c_i$ and $|\mathcal{Y}| = \sum_{J \in \binom{[s]}{\leq r}} \prod_{j \in J} d_j$, so our first aim is to show that $|A||B| \leq |\mathcal{X}||\mathcal{Y}|$.

Let $G = \binom{[m]}{\leq r}$. Let $v : G \to \mathbb{N}$ such that for each $G \in G$,

$$v(G) = \left| \left\{ L \in \mathcal{L}_{c}^{(r)} : L \cap ([m] \times [1]) = G \times [1] \right\} \right| .$$
Let \( \mathcal{H} = \binom{[n]}{c_n} \). Let \( w: \mathcal{H} \to \mathbb{N} \) such that for each \( H \in \mathcal{H} \),
\[
    w(H) = \left| \left\{ L \in \mathcal{L}_{d}^{(s)}: L \cap ([n] \times [1]) = H \times [1] \right\} \right|.
\]

Let \( l = \max\{m, n\} \) and \( h = \max\{c_m, d_n\} \). Let
\[
    \mathcal{A}^* = \Gamma_{l,h} \circ \cdots \circ \Gamma_{l,2} \circ \cdots \circ \Gamma_{2,h} \circ \cdots \circ \Gamma_{1,h} \circ \cdots \circ \Gamma_{1,2}(\mathcal{A}),
    \mathcal{B}^* = \Gamma_{l,h} \circ \cdots \circ \Gamma_{l,2} \circ \cdots \circ \Gamma_{2,h} \circ \cdots \circ \Gamma_{1,h} \circ \cdots \circ \Gamma_{1,2}(\mathcal{B}).
\]

Now let
\[
    \mathcal{C} = \{ G \in \mathcal{G}: E \cap ([m] \times [1]) = G \times [1] \text{ for some } E \in \mathcal{A}^* \},
    \mathcal{D} = \{ H \in \mathcal{H}: F \cap ([n] \times [1]) = H \times [1] \text{ for some } F \in \mathcal{B}^* \}.
\]

So \( \mathcal{C} \subseteq \mathcal{G} \), \( \mathcal{D} \subseteq \mathcal{H} \), and by Corollary 10, \( \mathcal{C} \) and \( \mathcal{D} \) are cross-intersecting. We have \( \mathcal{A}^* \subseteq \bigcup_{C \in \mathcal{C}} \{ L \in \mathcal{L}_{c}^{(r)}: L \cap ([m] \times [1]) = C \times [1] \} \) and \( \mathcal{B}^* \subseteq \bigcup_{D \in \mathcal{D}} \{ L \in \mathcal{L}_{d}^{(s)}: L \cap ([n] \times [1]) = D \times [1] \} \). So
\[
    |A^*| \leq \sum_{C \in \mathcal{C}} v(C) = v(C) \quad \text{and} \quad |B^*| \leq \sum_{D \in \mathcal{D}} w(D) = w(D). \tag{22}
\]

Since \( |A| = |A^*| \) and \( |B| = |B^*| \), we therefore have
\[
    |A| \leq v(C) \quad \text{and} \quad |B| \leq w(D). \tag{23}
\]

Let \( \mathcal{I} = \{ G \in \mathcal{G}: 1 \in G \} \) and \( \mathcal{J} = \{ H \in \mathcal{H}: 1 \in H \} \). By Lemma 12 and Theorem 2,
\[
    v(C)w(D) \leq v(\mathcal{I})w(\mathcal{J}). \tag{24}
\]

Now
\[
    v(\mathcal{I}) = \sum_{I \in \mathcal{I}} v(I) = \sum_{I \in \mathcal{I}} \left| \left\{ L \in \mathcal{L}_{c}^{(r)}: L \cap ([m] \times [1]) = I \times [1] \right\} \right| = \left| \left\{ L \in \mathcal{L}_{c}^{(r)}: L \cap ([m] \times [1]) = I \times [1] \right\} \right| = |\mathcal{X}|
\]

and similarly \( w(\mathcal{J}) = |\mathcal{Y}| \). Together with (23) and (24), this gives us \( |A||B| \leq |\mathcal{X}||\mathcal{Y}| \).

Suppose \( |A||B| = |\mathcal{X}||\mathcal{Y}| \). Then all the inequalities in (22)–(24) are equalities. The equalities in (22) imply that \( \mathcal{A}^* = \bigcup_{C \in \mathcal{C}} \{ L \in \mathcal{L}_{c}^{(r)}: L \cap ([m] \times [1]) = C \times [1] \} \) and \( \mathcal{B}^* = \bigcup_{D \in \mathcal{D}} \{ L \in \mathcal{L}_{d}^{(s)}: L \cap ([n] \times [1]) = D \times [1] \} \). Suppose \( c_1 \geq 3 \) and \( d_1 \geq 3 \). By Lemma 12 and Theorem 2, equality in (24) gives us that for some \( p \in [m] \cap [n] \), \( \mathcal{C} = \mathcal{G}(p) \) and \( \mathcal{D} = \mathcal{H}(p) \). It follows that \( \mathcal{A}^* = \{ L \in \mathcal{L}_{c}^{(r)}: (p, 1) \in L \} \) and \( \mathcal{B}^* = \{ L \in \mathcal{L}_{d}^{(s)}: (p, 1) \in L \} \). By Lemma 11, \( \mathcal{A} = \{ L \in \mathcal{L}_{c}^{(r)}: (p, q) \in L \} \) and \( \mathcal{B} = \{ L \in \mathcal{L}_{d}^{(s)}: (p, q) \in L \} \) for some \( q \in [c_p] \cap [d_p] \). So \( \mathcal{A} \) is a star of \( \mathcal{L}_{c}^{(r)} \) with centre \( (p, q) \), and \( \mathcal{B} \) is a star of \( \mathcal{L}_{d}^{(s)} \) with centre \( (p, q) \). Now clearly \( \mathcal{X} \) is a star of \( \mathcal{L}_{c}^{(r)} \) of maximum size, and \( \mathcal{Y} \) is a star of \( \mathcal{L}_{d}^{(s)} \) of maximum size. Thus, since \( |A||B| = |\mathcal{X}||\mathcal{Y}| \), \( |A| = |\mathcal{X}| \) and \( |B| = |\mathcal{Y}| \). So \( \mathcal{A} \) is a star of \( \mathcal{L}_{c}^{(r)} \) of maximum size, and hence we must have \( c_p = c_1 \). Similarly, \( d_p = d_1 \). \( \square \)
Proof of Theorem 4. Since $|A| \leq |L_c|$ and $|B| \leq |L_c|$, the result is trivial if $c_1 = 1$. If $c_1 \geq 3$, then the result is given by Theorem 3.

Finally, suppose $c_1 = 2$. Let mod* be the usual modulo operation with the exception that for any $a, b \in \mathbb{N}$, $(ba)$ mod* $a$ is $a$ rather than $0$. Let $\theta : L_c \to L_c$ such that $\theta(E) = \{(i, (j + 1) \mod a) : (i,j) \in E\}$ for each $E \in L_c$. Clearly, $\theta$ is a bijection, and $\theta(E) \cap E = \emptyset$ for each $E \in L_c$. Thus, since $A$ and $B$ are cross-intersecting, $\theta(C) \notin B$ for each $C \in A$, and hence $|B| \leq |L_c| - |A|$. Since $0 \leq (|A| - \frac{1}{2}|L_c|)^2 = |A|^2 - |A||L_c| + \frac{1}{2}|L_c|^2$, we have $|A|(|L_c| - |A|) \leq (\frac{1}{2}|L_c|)^2$, and hence $|A||B| \leq \left(\frac{1}{c_1}|L_c|\right)^2 = |L_c((1,1))|^2$. \hfill \Box

5 Proof of Theorem 5

In this section, we use Theorem 2 to prove Theorem 5. Recall that for any $n, r \in \mathbb{N}$, $M_{n,r}$ denotes the set $\{(a_1, \ldots, a_r) : a_1 \leq \ldots \leq a_r, a_1, \ldots, a_r \in [n]\}$.

For any family $F$ of sets, let $F^r$ denote the family $\{F \in F : |F| = r\}$, and let $M_{n,r,F}$ denote the set $\{A \in M_{n,r} : S_A \in F\}$.

Lemma 13. If $n, r \in \mathbb{N}$, $i, j \in [n]$, and $F \subseteq 2^n$, then $|M_{n,r,\Delta_{i,j}(F)}| = |M_{n,r,F}|$.

Proof. Let $I = \Delta_{i,j}(F)$. Clearly, $|I(p)| = |F(p)|$ for each $p \in [n]$. We have

$$|M_{n,r,I}| = \sum_{I \in I} |M_{n,r,\{I\}}| = \sum_{p=1}^n \sum_{I \in I(p)} |M_{n,r,\{I\}}| = \sum_{p=1}^n |I(p)||M_{n,r,\{p\}}|$$

$$= \sum_{p=1}^n |F(p)||M_{n,r,\{p\}}| = \sum_{p=1}^n \sum_{F \in F(p)} |M_{n,r,\{F\}}| = \sum_{F \in F} |M_{n,r,\{F\}}| = |M_{n,r,F}|,$$

as required. \hfill \Box

Proof of Theorem 5. Let $A$ and $B$ be as in the statement of the theorem. Let $C = \{S_A : A \in A\}$ and $D = \{S_B : B \in B\}$. Clearly, $A \subseteq M_{n,r,c}$ and $B \subseteq M_{n,s,d}$. Since $A$ and $B$ are cross-intersecting, $C$ and $D$ are cross-intersecting.

By Lemma 8(iii), we can apply left-compressions to $C$ and $D$ simultaneously until we obtain two compressed cross-intersecting families $C^*$ and $D^*$, respectively. Since $C \subseteq \binom{[m]}{\leq c}$ and $D \subseteq \binom{[n]}{\leq s}$, we have $C^* \subseteq \binom{[m]}{\leq r}$ and $D^* \subseteq \binom{[n]}{\leq s}$. By Lemma 8(ii),

$$C \cap D \cap [r + s - 1] \neq \emptyset \text{ for any } C \in C^* \text{ and any } D \in D^*.$$ \hfill (25)

Let $p = r + s - 1$. Let $G = \binom{[p]}{\leq r}$ and $H = \binom{[p]}{\leq s}$. Let $g : G \to \mathbb{N}$ such that $g(G) = \binom{m + r - p - 1}{r - |G|}$ for each $G \in G$. Let $h : H \to \mathbb{N}$ such that $h(H) = \binom{n + s - p - 1}{s - |H|}$ for each $H \in H$. For every $F, G \in G$ with $\emptyset \neq F \subseteq G$ and $|F| = |G| - 1$, we have
Similarly, $|A| \leq |M_{m,r} \mathcal{C}^*| \leq |\mathcal{M}| = \sum_{E \in \mathcal{E}} |\{A \in M_{m,r}: S_A \cap [p] = E\}|$

$$= \sum_{E \in \mathcal{E}} \left|\{(a_1, \ldots, a_{r-|E|}): a_1 \leq \ldots \leq a_{r-|E|}, a_1, \ldots, a_{r-|E|} \in E \cup [p+1, m]\}\right|$$

$$= \sum_{E \in \mathcal{E}} |M_{|E|+m-p,r-|E|}| = \sum_{E \in \mathcal{E}} \binom{m+r-p-1}{r-|E|} = g(\mathcal{E}). \quad (27)$$

Similarly,

$$|B| \leq h(\mathcal{F}). \quad (28)$$

By (26)–(28),

$$|A||B| \leq g(\mathcal{G}(1))h(\mathcal{H}(1)). \quad (29)$$

Now, similarly to (27),

$$g(\mathcal{G}(1)) = |\{A \in M_{m,r}: S_A \cap [p] = E \text{ for some } E \in \mathcal{G}(1)\}|$$

$$= |\{A \in M_{m,r}: 1 \in S_A\}| = \binom{m+r-2}{r-1}. \quad (27)$$

Similarly, $h(\mathcal{H}(1)) = \binom{n+s-2}{s-1}$. By (29), it follows that

$$|A||B| \leq \binom{m+r-2}{r-1}\binom{n+s-2}{s-1}.$$
as required.

Suppose $|A||B| = \binom{m+r-1}{r-t}\binom{n+s-2}{s-t}$ and $u \neq 0 \neq v$. Then equality holds throughout in each of (26)–(29), and hence $E = G(a)$ and $F = H(a)$ for some $a \in [p]$. Having equality throughout in (27) implies that $M_{m,r,c} = M = \{ A \in M_{m,r} : a \in S_A \}$. Thus $\{a\} \in C^*$, and hence there exists $a_1 \in [m]$ such that $\{a_1\} \in C$. Similarly, there exists $a_2 \in [n]$ such that $\{a_2\} \in D$. Since $C$ and $D$ are cross-intersecting, we have $a_1 = a_2$, $C \subseteq \{ C \in \binom{[m]}{m-r} : a_1 \in C \}$, and $D \subseteq \{ D \in \binom{[n]}{n-s} : a_1 \in D \}$. Consequently, $A \subseteq \{ A \in M_{m,r} : a_1 \in S_A \}$ and $B \subseteq \{ B \in M_{n,s} : a_1 \in S_B \}$. Since $|A||B| = \binom{m+r-2}{r-1}\binom{n+s-2}{s-1}$, both inclusion relations are actually equalities.
