## The Number of Solutions of $X^{2}=0$ in Triangular Matrices Over $G F(q)$

## Shalosh B. EKHAD ${ }^{1}$ and Doron ZEILBERGER ${ }^{1}$

Abstract: We prove an explicit formula for the number of $n \times n$ upper triangular matrices, over $G F(q)$, whose square is the zero matrix. This formula was recently conjectured by Sasha Kirillov and Anna Melnikov [KM].

Theorem. The number of $n \times n$ upper-triangular matrices over $G F(q)$ (the finite field with $q$ elements), whose square is the zero matrix, is given by the polynomial $C_{n}(q)$, where,

$$
\begin{aligned}
C_{2 n}(q) & =\sum_{j}\left[\binom{2 n}{n-3 j}-\binom{2 n}{n-3 j-1}\right] \cdot q^{n^{2}-3 j^{2}-j}, \\
C_{2 n+1}(q) & =\sum_{j}\left[\binom{n+1}{n-3 j}-\binom{2 n+1}{n-3 j-1}\right] \cdot q^{n^{2}+n-3 j^{2}-2 j} .
\end{aligned}
$$

Proof. In $[\mathrm{K}]$ it was shown that the quantity of interest is given by the polynomial $A_{n}(q)=$ $\sum_{r \geq 0} A_{n}^{r}(q)$, where the polynomials $A_{n}^{r}(q)$ are defined recursively by

$$
\begin{equation*}
A_{n+1}^{r+1}(q)=q^{r+1} \cdot A_{n}^{r+1}(q)+\left(q^{n-r}-q^{r}\right) \cdot A_{n}^{r}(q) \quad ; \quad A_{n+1}^{0}(q)=1 . \tag{Sasha}
\end{equation*}
$$

For any Laurent formal power series $P(w)$, let $C T_{w} P(w)$ denote the coefficient of $w^{0}$. Recall that the $q$-binomial coefficients are defined by

$$
\begin{equation*}
\binom{m}{n}_{q}:=\frac{\left(1-q^{m}\right)\left(1-q^{m-1}\right) \cdots\left(1-q^{m-n+1}\right)}{(1-q)\left(1-q^{2}\right) \cdots\left(1-q^{n}\right)}, \tag{Carl}
\end{equation*}
$$

whenever $0 \leq n \leq m$, and 0 otherwise.

Lemma 1. We have

$$
\begin{equation*}
A_{n}^{r}(q)=C T_{w}\left[\frac{(1-w)(1+w)^{n} q^{r(n-r)}}{w^{r}} \sum_{i=0}^{\infty}(-1)^{i} q^{-(i+1) i / 2-i(n-2 r)}\binom{i+n-2 r}{i}_{q} w^{i}\right] . \tag{Anna}
\end{equation*}
$$

Proof. Call the right side of Eq. (Anna), $S_{n}^{r}(q)$. Since $S_{n+1}^{0}(q)=1$, the lemma would follow by induction if we could show that

$$
S_{n+1}^{r+1}(q)-q^{r+1} \cdot S_{n}^{r+1}(q)-\left(q^{n-r}-q^{r}\right) \cdot S_{n}^{r}(q)=0 .
$$

[^0]Using the linearity of $C T_{w}$, manipulating the series, using the definition (Carl) of the $q$-binomial coefficients, and simplifying, brings the left side of (Sasha') to be $C T_{w} \Phi_{n}^{r}(q, w)$, where $\Phi_{n}^{r}$ is zero except when $n$ is odd and $r=(n-1) / 2$, in which case it is a monomial in $q$ times $\frac{(1-w)(1+w)^{n}}{w^{r+1}}$, and applying $C T_{w}$ kills it all the same, thanks to the symmetry of the Chu-Pascal triangle.

Summing the expression proved for $A_{n}^{r}(q)$, yields that

$$
A_{n}(q)=C T_{w}\left[(1-w)(1+w)^{n} \cdot \sum_{r=0}^{\infty} \sum_{i=0}^{r}(-1)^{i} q^{r(n-r)-(i+1) i / 2-i(n-2 r)}\binom{i+n-2 r}{n-2 r}_{q} w^{i-r}\right]
$$

Letting $l=r-i$, and changing the order of summation, yields

$$
A_{n}(q)=C T_{w}\left[(1-w)(1+w)^{n} \cdot \sum_{\ell=0}^{\lfloor n / 2\rfloor} w^{-\ell} \cdot q^{\ell n-\ell^{2}} \sum_{i=0}^{\lfloor(n-2 \ell) / 2\rfloor}(-1)^{i} q^{i(i-1) / 2}\binom{n-2 \ell-i}{i}_{q}\right]
$$

(SumAnna)
Luckily, the inner sum evaluates nicely thanks to the following.

Lemma 2. We have

$$
\sum_{i=0}^{\lfloor m / 2\rfloor}(-1)^{i} q^{i(i-1) / 2}\binom{m-i}{i}_{q}=(-1)^{\lfloor m / 3\rfloor} q^{m(m-1) / 6} \cdot \chi(m \not \equiv 2 \bmod 3),
$$

where $\chi(\cdots)$ is the truth value ( $=1$ or 0 ) of the proposition "...".
Proof. While this is unlikely to be new ${ }^{2}$, it is also irrelevant whether or not it is new, since such things are now routine, thanks to the package qEKHAD, accompanying [PWZ]. Let's call the left side divided by $q^{m(m-1) / 6}, Z(m)$. Then we have to prove that $Z_{0}(m):=Z(3 m)$ equals $(-1)^{m}$, $Z_{1}(m):=Z(3 m+1)$ equals $(-1)^{m}$, and $Z_{2}(m):=Z(3 m+2)$ equals 0 . It is directly verified that these are true for $m=0,1$, and the general result follows from the second order recurrences produced by qEKHAD. The input files inZ0, inZ1, inZ2 as well as the corresponding output files, outZO, outZ1, outZ2 can be obtained by anonymous ftp to ftp.math.temple.edu, directory pub/ekhad/sasha. The package qEKHAD can be downloaded from http://www.math.temple.edu/~zeilberg.

To complete the proof of the theorem, we use lemma 2 to evaluate the inner sum of (SumAnna), then to get $A_{2 n}(q)$, we replace $n$ by $2 n$, and then replace $l$ by $l+n$, and finally use the binomial theorem. Similarly for $A_{2 n+1}(q)$.
